

Innovative period tech

As new tech attempts to solve every issue in our modern world, the problems that periods bring to the lives of women are no exception. There has been an influx of menstruation technology over the last few years including electronic devices that can stop period pains to period underwear. Here are some of the latest.

Transcutaneous electrical nerve stimulation (TENS) uses a mild electrical current to treat pain and has been around since the mid seventies. This period tech machine connects to the body via sticky pads and generates small electrical impulses that help to relieve pain and relax muscles. They do this by reducing the pain signals going to the spinal cord and brain and stimulating the production of endorphins.
